

Solution Health Check

A three-week project where Zure does an efficient investigation into the health of your Azure-based solution. The purpose is to help you evaluate the solution's health regarding the architectural patterns, Microsoft best practices and utilized Azure products, giving you the tools to make decisions on the best way forward. Your solution can be a B2C app, B2B SaaS product or a custom enterprise app.

THE PROJECT

- The deliverable is a Findings document describing your solution's health
- The findings are about the architectural decisions and patterns, data storage usage and data models, utilization of Azure products, good industry standards, messaging patterns, configurations, coding conventions, and so forth
- The health check is executed with two architects to ensure unbiased findings

The project starts with a kick-off meeting and ends with a walkthrough of the Findings documentation. In between we'll have meetings with your developers as required.

THE PURPOSE

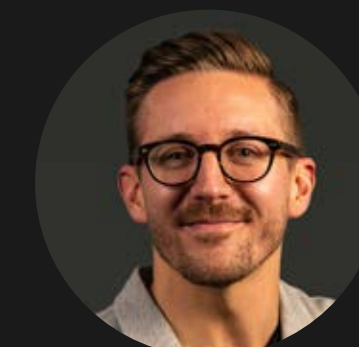

- Understand if the architecture is fit-for-purpose for the long-term vision of the solution
- Train the current development team on the relevant best practices
- Make sure that the Azure usage is cost efficient
- Realize the next steps in improving the solution in scalability, robustness or production-readiness
- Produce the reasonable options regarding future development and support
